

# Package ‘coreNLP’

October 12, 2022

**Type** Package

**Title** Wrappers Around Stanford CoreNLP Tools

**Version** 0.4-3

**Author** Taylor Arnold, Lauren Tilton

**Maintainer** Taylor Arnold <tarnold2@richmond.edu>

**Description** Provides a minimal interface for applying  
annotators from the 'Stanford CoreNLP' java library. Methods  
are provided for tasks such as tokenisation, part of speech  
tagging, lemmatisation, named entity recognition, coreference  
detection and sentiment analysis.

**Imports** rJava, XML

**SystemRequirements** Java (>= 7.0); Stanford CoreNLP  
<<http://nlp.stanford.edu/software/corenlp.shtml>> (>= 3.5.2)

**License** GPL-2

**LazyData** true

**RoxygenNote** 5.0.1

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2022-08-17 13:40:09 UTC

## R topics documented:

annoEtranger.rda . . . . .	2
annoHp.rda . . . . .	2
annotateFile . . . . .	3
annotateString . . . . .	3
downloadCoreNLP . . . . .	4
getCoreference . . . . .	5
getDependency . . . . .	5
getOpenIE . . . . .	6
getParse . . . . .	6

getSentiment . . . . .	7
getToken . . . . .	7
initCoreNLP . . . . .	8
loadXMLAnnotation . . . . .	9
parseAnnoXML . . . . .	9
print.annotation . . . . .	10
universalTagset . . . . .	10

<b>Index</b>	<b>11</b>
--------------	-----------

---

**annoEtranger.rda**      *Annotation of first two lines of Albert Camus' L'Etranger*

---

### Description

Parsed via the Stanford CoreNLP Java Library

### Usage

`annoEtranger`

### Format

a annotation object

### Author(s)

Taylor Arnold, 2015-06-03

---

**annoHp.rda**      *Annotation of first line of JK Rowling's The Philosopher's Stone*

---

### Description

Parsed via the Stanford CoreNLP Java Library

### Usage

`annoHp`

### Format

a annotation object

### Author(s)

Taylor Arnold, 2015-06-03

---

annotateFile*Annotate a text file*

---

**Description**

Runs the CoreNLP annotators for the text contained in a given file. The details for which annotators to run and how to run them are specified in the properties file loaded in via the `initCoreNLP` function (which must be run prior to any annotation).

**Usage**

```
annotateFile(file, format = c("obj", "xml", "text"), outputFile = NA,  
           includeXSL = FALSE)
```

**Arguments**

- |                         |  |
|-------------------------|--|
| <code>file</code>       | a string giving the location of the file to be loaded.   |
| <code>format</code>     | the desired output format. Option <code>obj</code> , the default, returns an R object of class <code>annotation</code> and will likely be the desired choice for users loading the output into R. The <code>xml</code> and <code>text</code> exist primarily for saving the files on the disk. |
| <code>outputFile</code> | character string indicating where to put the output. If set to NA, the output will be returned by the function.  |
| <code>includeXSL</code> | boolean. Whether the xml style sheet should be included in the output. Only used if <code>format</code> is <code>xml</code> and <code>outputFile</code> is not NA.   |

---

annotateString*Annotate a string of text*

---

**Description**

Runs the CoreNLP annotators over a given string of text. The details for which annotators to run and how to run them are specified in the properties file loaded in via the `initCoreNLP` function (which must be run prior to any annotation).

**Usage**

```
annotateString(text, format = c("obj", "xml", "text"), outputFile = NA,  
              includeXSL = FALSE)
```

## Arguments

<code>text</code>	a vector of strings for which an annotation is desired. Will be collapsed to length 1 using new line characters prior to the annotation.
<code>format</code>	the desired output format. Option <code>obj</code> , the default, returns an R object of class <code>annotation</code> and will likely be the desired choice for most users. The <code>xml</code> and <code>text</code> exist primarily for subsequently saving to disk.
<code>outputFile</code>	character string indicating where to put the output. If set to NA, the output will be returned by the function.
<code>includeXSL</code>	boolean. Whether the xml style sheet should be included in the output. Only used if <code>format</code> is <code>xml</code> and <code>outputFile</code> is not NA.

## Examples

```
## Not run:
initCoreNLP()
sIn <- "Mother died today. Or, maybe, yesterday; I can't be sure."
annoObj <- annotateString(sIn)

## End(Not run)
```

downloadCoreNLP

*Download java files needed for coreNLP*

## Description

The coreNLP package does not supply the raw java files provided by the Stanford NLP Group as they are quite large. This function downloads the libraries for you, by default into the directory where the package was installed.

## Usage

```
downloadCoreNLP(outputLoc, type = c("base", "chinese", "english", "french",
  "german", "spanish"))
```

## Arguments

<code>outputLoc</code>	a string showing where the files are to be downloaded. If missing, will try to download files into the directory where the package was originally installed.
<code>type</code>	type of files to download. The base package, installed by default is required. Other jars include chinese, german, and spanish. These will be installed in addition to the base package.

## Details

If you want to manually download files, simply unzip them and place in `system.file("extdata", package="coreNLP")`

**Examples**

```
## Not run:  
downloadCoreNLP()  
downloadCoreNLP(type="spanish")  
  
## End(Not run)
```

---

getCoreference	<i>Get Coreference</i>
----------------	------------------------

---

**Description**

Returns a dataframe containing all coreferences detected in the text.

**Usage**

```
getCoreference(annotation)
```

**Arguments**

annotation      an annotation object

**Examples**

```
getCoreference(annoHp)
```

---

getDependency	<i>Get Dependencies</i>
---------------	-------------------------

---

**Description**

Returns a data frame of the coreferences of an annotation

**Usage**

```
getDependency(annotation, type = c("CCprocessed", "basic", "collapsed"))
```

**Arguments**

annotation      an annotation object  
type            the class of coreference desired

**Examples**

```
getDependency(annoEtranger)  
getDependency(annoHp)
```

---

`getOpenIE`*Get OpenIE*

---

**Description**

Returns a dataframe containing all OpenIE triples.

**Usage**

```
getOpenIE(annotation)
```

**Arguments**

annotation      an annotation object

**Examples**

```
getOpenIE(annoHp)
```

---

`getParse`*Get parse tree as character vector*

---

**Description**

Returns a character vector of the parse trees. Mostly use for visualization; the output of `getToken` will generally be more convenient for manipulating in R.

**Usage**

```
getParse(annotation)
```

**Arguments**

annotation      an annotation object

**Examples**

```
getParse(annoEtranger)
```

---

<code>getSentiment</code>	<i>Get Sentiment scores</i>
---------------------------	-----------------------------

---

### Description

Returns a data frame of the sentiment scores from an annotation

### Usage

```
getSentiment(annotation)
```

### Arguments

`annotation`      an annotation object

### Examples

```
getSentiment(annoEtranger)  
getSentiment(annoHp)
```

---

<code>getToken</code>	<i>Get tokens as data frame</i>
-----------------------	---------------------------------

---

### Description

Returns a data frame of the tokens from an annotation object.

### Usage

```
getToken(annotation)
```

### Arguments

`annotation`      an annotation object

### Examples

```
getToken(annoEtranger)
```

**initCoreNLP***Initialize the CoreNLP java object*

## Description

This must be run prior to calling any other CoreNLP functions. It may be called multiple times in order to specify a different parameter set, but note that if you use a different configuration during the same R session it must have a unique name.

## Usage

```
initCoreNLP(libLoc, type = c("english", "english_all", "english_fast",
  "arabic", "chinese", "french", "german", "spanish"), parameterFile = NULL,
  mem = "4g")
```

## Arguments

<code>libLoc</code>	a string giving the location of the CoreNLP java files. This should point to a directory which contains, for example the file "stanford-corenlp-*jar", where "*" is the version number. If missing, the function will try to find the library in the environment variable CORENLP_HOME, and otherwise will fail.
<code>type</code>	type of model to load. Ignored if parameterFile is set.
<code>parameterFile</code>	the path to a parameter file. See the CoreNLP documentation for an extensive list of options. If missing, the package will simply specify a list of standard annotators and otherwise only use default values.
<code>mem</code>	a string giving the amount of memory to be assigned to the rJava engine. For example, "6g" assigned 6 gigabytes of memory. At least 2 gigabytes are recommended at a minimum for running the CoreNLP package. On a 32bit machine, where this is not possible, setting "1800m" may also work. This option will only have an effect the first time <code>initCoreNLP</code> is called, and also will not have an effect if the java engine is already started by a seperate process.

## Examples

```
## Not run:
initCoreNLP()
sIn <- "Mother died today. Or, maybe, yesterday; I can't be sure."
annoObj <- annotateString(sIn)

## End(Not run)
```

---

loadXMLAnnotation	<i>Load CoreNLP XML file</i>
-------------------	------------------------------

---

## Description

Loads a properly formated XML file output by the CoreNLP library into an annotation object in R.

## Usage

```
loadXMLAnnotation(file, encoding = "unknown")
```

## Arguments

file	connection or character string giving the file name to load
encoding	encoding to be assumed for input strings. It is used to mark character strings as known to be in Latin-1 or UTF-8: it is not used to re-encode the input. Passed to <code>readLines</code> .

---

parseAnnoXML	<i>Parse annotation xml</i>
--------------	-----------------------------

---

## Description

Returns an annotation object from a character vector containing the xml. Not exported; use `loadXMLAnnotation` instead.

## Usage

```
parseAnnoXML(xml)
```

## Arguments

xml	character vector containing the xml file from an annotation
-----	---

<code>print.annotation</code>	<i>Print a summary of an annotation object</i>
-------------------------------	--

### Description

Print a summary of an annotation object

### Usage

```
## S3 method for class 'annotation'
print(x, ...)
```

### Arguments

x	an annotation object
...	other arguments. Currently unused.

### Examples

```
print(annoEtranger)
```

<code>universalTagset</code>	<i>Convert Penn TreeBank POS to Universal Tagset</i>
------------------------------	--

### Description

Maps a character string of English Penn TreeBank part of speech tags into the universal tagset codes. This provides a reduced set of tags (12), and a better cross-linguist model of speech.

### Usage

```
universalTagset(pennPOS)
```

### Arguments

pennPOS	a character vector of penn tags to match
---------	--

### Examples

```
tok <- getToken(annoEtranger)
cbind(tok$POS,universalTagset(tok$POS))
```
