# Package 'webmockr'

June 29, 2025

Title Stubbing and Setting Expectations on 'HTTP' Requests

```
Description Stubbing and setting expectations on 'HTTP' requests.
      Includes tools for stubbing 'HTTP' requests, including expected
      request conditions and response conditions. Match on
      'HTTP' method, query parameters, request body, headers and
      more. Can be used for unit tests or outside of a testing
      context.

enable

Enable or disable webmockr

# Description

Enable or disable webmockr

# Usage

```
enable(adapter = NULL, options = list(), quiet = FALSE)
enabled(adapter = "crul")
disable(adapter = NULL, options = list(), quiet = FALSE)
```

httr2\_mock 3

## Arguments

adapter (character) the adapter name, 'crul', 'httr', or 'httr2'. one or the other. if none

given, we attempt to enable both adapters

options list of options - ignored for now.

quiet (logical) suppress messages? default: FALSE

## **Details**

• enable() enables webmockr for all adapters

• disable() disables webmockr for all adapters

• enabled() answers whether **webmockr** is enabled for a given adapter

#### Value

enable() and disable() invisibly returns booleans for each adapter, as a result of running enable or disable, respectively, on each HttpLibAdapaterRegistry object. enabled returns a single boolean

httr2\_mock

Turn on httr2 mocking

## **Description**

Sets a callback that routes httr2 requests through webmockr

# Usage

```
httr2_mock(on = TRUE)
```

# Arguments

on

(logical) TRUE to turn on, FALSE to turn off. default: TRUE

## Value

Silently returns TRUE when enabled and FALSE when disabled.

4 including

httr\_mock

Turn on httr mocking

# Description

Sets a callback that routes httr requests through webmockr

## Usage

```
httr_mock(on = TRUE)
```

# Arguments

on

(logical) set to TRUE to turn on, and FALSE to turn off. default: TRUE

## Value

Silently returns TRUE when enabled and FALSE when disabled.

including

Partially match request query parameters or request bodies

# Description

```
For use inside wi_th()
```

## Usage

```
including(x)
excluding(x)
```

## **Arguments**

Х

(list) a list; may support other classes in the future

## Value

same as x, but with two attributes added:

- partial\_match: always TRUE
- partial\_type: the type of match, one of include or exclude

last\_request 5

## Headers

Matching on headers already handles partial matching. That is, wi\_th(headers = list(Fruit = "pear")) matches any request that has any request header that matches - the request can have other request headers, but those don't matter as long as there is a match. These helpers (including/excluding) are needed for query parameters and bodies because by default matching must be exact for those.

## **Examples**

```
including(list(foo = "bar"))
excluding(list(foo = "bar"))
# get just keys by setting values as NULL
including(list(foo = NULL, bar = NULL))
# in a stub
req <- stub_request("get", "https://httpbin.org/get")</pre>
req
## query
wi_th(req, query = list(foo = "bar"))
wi_th(req, query = including(list(foo = "bar")))
wi_th(req, query = excluding(list(foo = "bar")))
## body
wi_th(req, body = list(foo = "bar"))
wi_th(req, body = including(list(foo = "bar")))
wi_th(req, body = excluding(list(foo = "bar")))
# cleanup
stub_registry_clear()
```

last\_request

Get the last HTTP request made

## **Description**

Get the last HTTP request made

# Usage

```
last_request()
```

#### Value

NULL if no requests registered; otherwise the last registered request made as a RequestSignature class

6 last\_stub

## **Examples**

```
# no requests
request_registry_clear()
last_request()

# a request is found
enable()
stub_request("head", "https://nytimes.com")
library(crul)
crul::ok("https://nytimes.com")
last_request()

# cleanup
request_registry_clear()
stub_registry_clear()
```

last\_stub

Get the last stub created

## **Description**

Get the last stub created

# Usage

```
last_stub()
```

## Value

NULL if no stubs found; otherwise the last stub created as a StubbedRequest class

```
# no requests
stub_registry_clear()
last_stub()

# a stub is found
stub_request("head", "https://nytimes.com")
last_stub()

stub_request("post", "https://nytimes.com/stories")
last_stub()

# cleanup
stub_registry_clear()
```

mocking-disk-writing

mocking-disk-writing Mocking writing to disk

## Description

Mocking writing to disk

```
# enable mocking
enable()
# Write to a file before mocked request -----
# crul
library(crul)
## make a temp file
f <- tempfile(fileext = ".json")</pre>
## write something to the file
cat("{\"hello\":\"world\"}\n", file = f)
readLines(f)
## make the stub
stub_request("get", "https://httpbin.org/get") %>%
  to_return(body = file(f))
## make a request
(out <- HttpClient$new("https://httpbin.org/get")$get(disk = f))</pre>
out$content
readLines(out$content)
stub_registry_clear()
# httr
library(httr)
## make a temp file
f <- tempfile(fileext = ".json")</pre>
## write something to the file
cat("{\"hello\":\"world\"}\n", file = f)
readLines(f)
## make the stub
stub_request("get", "https://httpbin.org/get") %>%
  to_return(
   body = file(f),
   headers = list("content-type" = "application/json")
## make a request
## with httr, you must set overwrite=TRUE or you'll get an errror
out <- GET("https://httpbin.org/get", write_disk(f, overwrite = TRUE))</pre>
out
out$content
content(out, "text", encoding = "UTF-8")
stub_registry_clear()
```

mocking-disk-writing

```
# httr2
library(httr2)
## make a temp file
f <- tempfile(fileext = ".json")</pre>
## write something to the file
cat("{\"hello\":\"world\"}\n", file = f)
readLines(f)
## make the stub
stub_request("get", "https://httpbin.org/get") %>%
  to_return(
    body = file(f),
    headers = list("content-type" = "application/json")
## make a request
req <- request("https://httpbin.org/get")</pre>
out <- req_perform(req, path = f)</pre>
out
out$body
out$headers
readLines(out$body)
stub_registry_clear()
# Use mock_file to have webmockr handle file and contents -----
# crul
library(crul)
f <- tempfile(fileext = ".json")</pre>
## make the stub
stub_request("get", "https://httpbin.org/get") %>%
  to_return(body = mock_file(f, "{\"hello\":\"mars\"}\n"))
## make a request
(out <- crul::HttpClient$new("https://httpbin.org/get")$get(disk = f))</pre>
out$content
readLines(out$content)
stub_registry_clear()
# httr
library(httr)
## make a temp file
f <- tempfile(fileext = ".json")</pre>
## make the stub
stub_request("get", "https://httpbin.org/get") %>%
  to_return(
    body = mock_file(path = f, payload = "{\"foo\": \"bar\"}"),
    headers = list("content-type" = "application/json")
## make a request
out <- GET("https://httpbin.org/get", write_disk(f))</pre>
## view stubbed file content
out$content
readLines(out$content)
```

mock\_file 9

```
content(out, "text", encoding = "UTF-8")
stub_registry_clear()
# httr2
library(httr2)
## make a temp file
f <- tempfile(fileext = ".json")</pre>
## make the stub
stub_request("get", "https://httpbin.org/get") %>%
  to_return(
    body = mock_file(path = f, payload = "{\"foo\": \"bar\"}"),
    headers = list("content-type" = "application/json")
## make a request
req <- request("https://httpbin.org/get")</pre>
out <- req_perform(req, path = f)</pre>
out
## view stubbed file content
out$body
readLines(out$body)
stub_registry_clear()
# disable mocking
disable()
```

mock\_file

Mock file

## **Description**

Mock file

## Usage

```
mock_file(path, payload)
```

## **Arguments**

path (character) a file path. required

payload (character) string to be written to the file given at path parameter. required

## Value

```
a list with S3 class mock_file
```

```
mock_file(path = tempfile(), payload = "{\"foo\": \"bar\"}")
```

RequestPattern

remove\_request\_stub

Remove a request stub

# Description

Remove a request stub

# Usage

```
remove_request_stub(stub)
```

## **Arguments**

stub

a request stub, of class StubbedRequest

## Value

logical, TRUE if removed, FALSE if not removed

## See Also

```
Other stub-registry: StubRegistry, stub_registry(), stub_registry_clear()
```

## **Examples**

```
(x <- stub_request("get", "https://httpbin.org/get"))
stub_registry()
remove_request_stub(x)
stub_registry()</pre>
```

RequestPattern

RequestPattern class

# Description

Class handling all request matchers

#### **Public fields**

```
method_pattern xxx
uri_pattern xxx
body_pattern xxx
headers_pattern xxx
```

RequestPattern 11

## Methods

```
Public methods:
  • RequestPattern$new()
  • RequestPattern$matches()
  • RequestPattern$to_s()
  • RequestPattern$clone()
Method new(): Create a new RequestPattern object
 Usage:
 RequestPattern$new(
   method,
   uri = NULL,
   uri_regex = NULL,
   query = NULL,
   body = NULL,
   headers = NULL,
   basic_auth = NULL
 )
 Arguments:
 method the HTTP method (any, head, options, get, post, put, patch, trace, or delete). "any"
     matches any HTTP method. required.
 uri (character) request URI. required or uri_regex
 uri_regex (character) request URI as regex. required or uri
 query (list) query parameters, optional
 body (list) body request, optional
 headers (list) headers, optional
 basic_auth (list) vector of length 2 (username, password), optional
 Returns: A new RequestPattern object
Method matches(): does a request signature match the selected matchers?
 Usage:
 RequestPattern$matches(request_signature)
 Arguments:
 request_signature a RequestSignature object
 Returns: a boolean
Method to_s(): Print pattern for easy human consumption
 Usage:
 RequestPattern$to_s()
 Returns: a string
Method clone(): The objects of this class are cloneable with this method.
```

RequestPattern\$clone(deep = FALSE)

deep Whether to make a deep clone.

Arguments:

request\_registry

## See Also

pattern classes for HTTP method MethodPattern, headers HeadersPattern, body BodyPattern, and URI/URL UriPattern

request\_registry

List or clear requests in the request registry

#### **Description**

List or clear requests in the request registry

## Usage

```
request_registry()
request_registry_clear()
```

#### **Details**

request\_registry() lists the requests that have been made that webmockr knows about; request\_registry\_clear() resets the request registry (removes all recorded requests)

#### Value

an object of class RequestRegistry, print method gives the requests in the registry and the number of times each one has been performed

#### See Also

 $Other\ request-registry:\ Hash Counter,\ Request Registry$ 

```
webmockr::enable()
stub_request("get", "https://httpbin.org/get") %>%
    to_return(body = "success!", status = 200)

# nothing in the request registry
request_registry()

# make the request
z <- crul::HttpClient$new(url = "https://httpbin.org")$get("get")

# check the request registry - the request was made 1 time
request_registry()

# do the request again
z <- crul::HttpClient$new(url = "https://httpbin.org")$get("get")</pre>
```

stub\_body\_diff

```
# check the request registry - now it's been made 2 times, yay!
request_registry()

# clear the request registry
request_registry_clear()
webmockr::disable()
```

stub\_body\_diff

Get a diff of a stub request body and a request body from an http request

# Description

Requires the Suggested package diffobj

## Usage

```
stub_body_diff(stub = last_stub(), request = last_request())
```

## **Arguments**

stub object of class StubbedRequest. required. default is to call last\_stub(),

which gets the last stub created

request object of class RequestSignature. required. default is to call last\_request(),

which gets the last stub created

#### **Details**

Returns error message if either stub or request are NULL. Even though you may not intentionally pass in a NULL, the return values of last\_stub() and last\_request() when there's nothing found is NULL.

Under the hood the Suggested package diffobj is used to do the comparison.

## Value

object of class Diff from the diffobj package

## See Also

webmockr\_configure() to toggle webmockr showing request body diffs when there's not a match. stub\_body\_diff() is offered as a manual way to compare requests and stubs - whereas turning on with webmockr\_configure() will do the diff for you.

14 stub\_registry

## **Examples**

```
# stops with error if no stub and request
request_registry_clear()
stub_registry_clear()
stub_body_diff()
# Gives diff when there's a stub and request found - however, no request body
stub_request("get", "https://hb.opencpu.org/get")
enable()
library(crul)
HttpClient$new("https://hb.opencpu.org")$get(path = "get")
stub_body_diff()
# Gives diff when there's a stub and request found - with request body
stub_request("post", "https://hb.opencpu.org/post") %>%
  wi_th(body = list(apple = "green"))
enable()
library(crul)
HttpClient$new("https://hb.opencpu.org")$post(
  path = "post", body = list(apple = "red")
stub_body_diff()
# Gives diff when there's a stub and request found - with request body
stub_request("post", "https://hb.opencpu.org/post") %>%
  wi_th(body = "the quick brown fox")
HttpClient$new("https://hb.opencpu.org")$post(
  path = "post", body = "the quick black fox"
stub_body_diff()
```

stub\_registry

List stubs in the stub registry

## **Description**

List stubs in the stub registry

## Usage

```
stub_registry()
```

#### Value

an object of class StubRegistry, print method gives the stubs in the registry

## See Also

```
Other stub-registry: StubRegistry, remove_request_stub(), stub_registry_clear()
```

stub\_registry\_clear 15

## **Examples**

```
# make a stub
stub_request("get", "https://httpbin.org/get") %>%
    to_return(body = "success!", status = 200)

# check the stub registry, there should be one in there
stub_registry()

# make another stub
stub_request("get", "https://httpbin.org/get") %>%
    to_return(body = "woopsy", status = 404)

# check the stub registry, now there are two there
stub_registry()

# to clear the stub registry
stub_registry_clear()
```

```
stub_registry_clear stub_registry_clear
```

## **Description**

Clear all stubs in the stub registry

# Usage

```
stub_registry_clear()
```

## Value

an empty list invisibly

#### See Also

```
Other stub-registry: StubRegistry, remove_request_stub(), stub_registry()
```

```
(x <- stub_request("get", "https://httpbin.org/get"))
stub_registry()
stub_registry_clear()
stub_registry()</pre>
```

## Description

Stub an http request

## Usage

```
stub_request(method = "get", uri = NULL, uri_regex = NULL)
```

## Arguments

method	(character) HTTP method, one of "get", "post", "put", "patch", "head", "delete", "options" - or the special "any" (for any method)
uri	(character) The request uri. Can be a full or partial uri. <b>webmockr</b> can match uri's without the "http" scheme, but does not match if the scheme is "https". required, unless uri_regex given. See UriPattern for more. See the "uri vs. uri_regex" section
uri_regex	(character) A URI represented as regex. required, if uri not given. See examples and the "uri vs. uri_regex" section

#### **Details**

Internally, this calls StubbedRequest which handles the logic

See stub\_registry() for listing stubs, stub\_registry\_clear() for removing all stubs and remove\_request\_stub() for removing specific stubs

If multiple stubs match the same request, we use the first stub. So if you want to use a stub that was created after an earlier one that matches, remove the earlier one(s).

Note on wi\_th(): If you pass query, values are coerced to character class in the recorded stub. You can pass numeric, integer, etc., but all will be coerced to character.

See wi\_th() for details on request body/query/headers and to\_return() for details on how response status/body/headers are handled

#### Value

an object of class StubbedRequest, with print method describing the stub.

## uri vs. uri\_regex

When you use uri, we compare the URIs without query params AND also the query params themselves without the URIs.

When you use uri\_regex we don't compare URIs and query params; we just use your regex string defined in uri\_regex as the pattern for a call to grepl

## Mocking writing to disk

See mocking-disk-writing

#### **Error handling**

To construct stubs, one uses stub\_request() first - which registers the stub in the stub registry.
Any additional calls to modify the stub with for example wi\_th() or to\_return() can error. In those error cases we ideally want to remove (unregister) the stub because you certainly don't want a registered stub that is not exactly what you intended.

When you encounter an error creating a stub you should see a warning message that the stub has been removed, for example:

```
stub_request("get", "https://httpbin.org/get") %>%
    wi_th(query = mtcars)
#> Error in `wi_th()`:
#> ! z$query must be of class list or partial
#> Run `rlang::last_trace()` to see where the error occurred.
#> Warning message:
#> Encountered an error constructing stub
#> • Removed stub
#> • To see a list of stubs run stub_registry()
```

#### Note

Trailing slashes are dropped from stub URIs before matching

#### See Also

```
wi_th(), to_return(), to_timeout(), to_raise(), mock_file()
```

```
# basic stubbing
stub_request("get", "https://httpbin.org/get")
stub_request("post", "https://httpbin.org/post")

# any method, use "any"
stub_request("any", "https://httpbin.org/get")

stub_registry_clear()
```

to\_raise

Set raise error condition

## **Description**

Set raise error condition

# Usage

```
to_raise(.data, ...)
```

## **Arguments**

.data

input. Anything that can be coerced to a StubbedRequest class object

. . .

One or more HTTP exceptions from the **fauxpas** package. Run grep("HTTP\*", getNamespaceExports("fauxpas"), value = TRUE) for a list of possible exceptions

to\_return 21

## **Details**

The behavior in the future will be:

When multiple exceptions are passed, the first is used on the first mock, the second on the second mock, and so on. Subsequent mocks use the last exception

But for now, only the first exception is used until we get that fixed

#### Value

an object of class StubbedRequest, with print method describing the stub

## Raise vs. Return

to\_raise() always raises a stop condition, while to\_return(status=xyz) only sets the status code on the returned HTTP response object. So if you want to raise a stop condition then to\_raise() is what you want. But if you don't want to raise a stop condition use to\_return(). Use cases for each vary. For example, in a unit test you may have a test expecting a 503 error; in this case to\_raise() makes sense. In another case, if a unit test expects to test some aspect of an HTTP response object that httr, httr2, or crul typically returns, then you'll want to\_return().

## Note

see examples in stub\_request()

to\_return

Expectation for what's returned from a stubbed request

## **Description**

Set response status code, response body, and/or response headers

## Usage

```
to_return(.data, ..., .list = list(), times = 1)
```

## **Arguments**

.data	input. Anything that can be coerced to a StubbedRequest class object
• • •	Comma separated list of named variables. accepts the following: status, body, headers. See Details for more.
.list	named list, has to be one of 'status', 'body', and/or 'headers'. An alternative to passing in via Don't pass the same thing to both, e.g. don't pass 'status' to , and also 'status' to this parameter
times	(integer) number of times the given response should be returned; default: 1. value must be greater than or equal to 1. Very large values probably don't make sense, but there's no maximum value. See Details.

to\_return

#### **Details**

Values for status, body, and headers:

- status: (numeric/integer) three digit status code
- body: various: character, json, list, raw, numeric, NULL, FALSE, a file connection (other connection types not supported), or a mock\_file function call (see mock\_file())
- headers: (list) a named list, must be named

response headers are returned with all lowercase names and the values are all of type character. if numeric/integer values are given (e.g., to\_return(headers = list(a = 10))), we'll coerce any numeric/integer values to character.

#### Value

an object of class StubbedRequest, with print method describing the stub

## multiple to\_return()

You can add more than one to\_return() to a webmockr stub (including to\_raise(), to\_timeout()). Each one is a HTTP response returned. That is, you'll match to an HTTP request based on stub\_request() and wi\_th(); the first time the request is made, the first response is returned; the second time the request is made, the second response is returned; and so on.

Be aware that webmockr has to track number of requests (see request\_registry()), and so if you use multiple to\_return() or the times parameter, you must clear the request registry in order to go back to mocking responses from the start again. webmockr\_reset() clears the stub registry and the request registry, after which you can use multiple responses again (after creating your stub(s) again of course)

#### Raise vs. Return

to\_raise() always raises a stop condition, while to\_return(status=xyz) only sets the status code on the returned HTTP response object. So if you want to raise a stop condition then to\_raise() is what you want. But if you don't want to raise a stop condition use to\_return(). Use cases for each vary. For example, in a unit test you may have a test expecting a 503 error; in this case to\_raise() makes sense. In another case, if a unit test expects to test some aspect of an HTTP response object that httr, httr2, or crul typically returns, then you'll want to\_return().

#### Note

see more examples in stub\_request()

```
# first, make a stub object
foo <- function() {
   stub_request("post", "https://httpbin.org/post")
}
# add status, body and/or headers</pre>
```

to\_timeout 23

```
foo() %>% to_return(status = 200)
foo() %>% to_return(body = "stuff")
foo() %>% to_return(body = list(a = list(b = "world")))
foo() %>% to_return(headers = list(a = 5))
foo() %>%
    to_return(status = 200, body = "stuff", headers = list(a = 5))
# .list - pass in a named list instead
foo() %>% to_return(.list = list(body = list(foo = "bar")))
# multiple responses using chained `to_return()`
foo() %>%
    to_return(body = "stuff") %>%
    to_return(body = "things")
# many of the same response using the times parameter
foo() %>% to_return(body = "stuff", times = 3)
```

to\_timeout

Set timeout as an expected return on a match

## **Description**

Set timeout as an expected return on a match

## Usage

```
to_timeout(.data)
```

## **Arguments**

.data

input. Anything that can be coerced to a StubbedRequest class object

## Value

an object of class StubbedRequest, with print method describing the stub

## Note

```
see examples in stub_request()
```

24 webmockr\_configure

webmockr-defunct

Defunct functions in webmockr

## **Description**

```
webmockr_enable(): Function removed, see enable()
webmockr_disable(): Function removed, see disable()
to_return_: Only to_return() is available now
```

• wi\_th\_: Only wi\_th() is available now

webmockr\_configure

webmockr configuration

## **Description**

webmockr configuration

## Usage

```
webmockr_configure(
   allow_net_connect = FALSE,
   allow_localhost = FALSE,
   allow = NULL,
   show_stubbing_instructions = TRUE,
   show_body_diff = FALSE
)

webmockr_configure_reset()

webmockr_configuration()

webmockr_allow_net_connect()

webmockr_disable_net_connect(allow = NULL)

webmockr_net_connect_allowed(uri = NULL)
```

# Arguments

webmockr\_reset 25

#### webmockr\_allow\_net\_connect

If there are stubs found for a request, even if net connections are allowed (by running webmockr\_allow\_net\_connect()) the stubbed response will be returned. If no stub is found, and net connections are allowed, then a real HTTP request can be made.

```
webmockr_configure()
webmockr_configure(
 allow_localhost = TRUE
webmockr_configuration()
webmockr_configure_reset()
webmockr_allow_net_connect()
webmockr_net_connect_allowed()
# disable net connect for any URIs
webmockr_disable_net_connect()
### gives NULL with no URI passed
webmockr_net_connect_allowed()
# disable net connect EXCEPT FOR given URIs
webmockr_disable_net_connect(allow = "google.com")
### is a specific URI allowed?
webmockr_net_connect_allowed("google.com")
# show body diff
webmockr_configure(show_body_diff = TRUE)
# cleanup
webmockr_configure_reset()
```

26 wi\_th

## **Description**

Clear all stubs and the request counter

## Usage

```
webmockr_reset()
```

## **Details**

this function runs  $stub_registry_clear()$  and  $request_registry_clear()$  - so you can run those two yourself to achieve the same thing

## Value

nothing

## See Also

```
stub_registry_clear() request_registry_clear()
```

# **Examples**

```
# webmockr_reset()
```

wi\_th

Set additional parts of a stubbed request

## Description

Set query params, request body, request headers and/or basic\_auth

## Usage

```
wi_th(.data, ..., .list = list())
```

# Arguments

.data	input. Anything that can be coerced to a StubbedRequest class object
• • •	Comma separated list of named variables. accepts the following: query, body, headers, basic_auth. See Details.
.list	named list, has to be one of query, body, headers and/or basic_auth. An alternative to passing in via Don't pass the same thing to both, e.g. don't pass 'query' to , and also 'query' to this parameter

wi\_th 27

#### **Details**

with is a function in the base package, so we went with wi\_th Values for query, body, headers, and basic\_auth:

• query: (list) a named list. values are coerced to character class in the recorded stub. You can pass numeric, integer, etc., but all will be coerced to character.

- body: various, including character string, list, raw, numeric, upload (crul::upload(), httr::upload\_file(), curl::form\_file(), or curl::form\_data() they both create the same object in the end). for the special case of an empty request body use NA instead of NULL because with NULL we can't determine if the user did not supply a body or they supplied NULL to indicate an empty body.
- headers: (list) a named list
- basic\_auth: (character) a length two vector, username and password. We don't do any checking of the username/password except to detect edge cases where for example, the username/password were probably not set by the user on purpose (e.g., a URL is picked up by an environment variable). Only basic authentication supported <a href="https://en.wikipedia.org/wiki/Basic\_access\_authentication">https://en.wikipedia.org/wiki/Basic\_access\_authentication</a>.

Note that there is no regex matching on query, body, or headers. They are tested for matches in the following ways:

- query: compare stubs and requests with identical(). this compares named lists, so both list names and values are compared
- body: varies depending on the body format (list vs. character, etc.)
- headers: compare stub and request values with ==. list names are compared with %in%. basic\_auth is included in headers (with the name Authorization)

#### Value

an object of class StubbedRequest, with print method describing the stub

#### Note

```
see more examples in stub_request()
```

#### See Also

```
including()
```

```
# first, make a stub object
req <- stub_request("post", "https://httpbin.org/post")
# add body
# list
wi_th(req, body = list(foo = "bar"))
# string
wi_th(req, body = '{"foo": "bar"}')
# raw</pre>
```

28 wi\_th

```
wi_th(req, body = charToRaw('{"foo": "bar"}'))
# numeric
wi_th(req, body = 5)
# an upload
wi_th(req, body = crul::upload(system.file("CITATION")))
# wi_th(req, body = httr::upload_file(system.file("CITATION")))
# add query - has to be a named list
wi_th(req, query = list(foo = "bar"))
# add headers - has to be a named list
wi_th(req, headers = list(foo = "bar"))
wi_th(req, headers = list(`User-Agent` = "webmockr/v1", hello = "world"))
# .list - pass in a named list instead
wi_th(req, .list = list(body = list(foo = "bar")))
# basic authentication
wi_th(req, basic_auth = c("user", "pass"))
wi_th(req, basic_auth = c("user", "pass"), headers = list(foo = "bar"))
# partial matching, query params
## including
wi_th(req, query = including(list(foo = "bar")))
## excluding
wi_th(req, query = excluding(list(foo = "bar")))
# partial matching, body
## including
wi_th(req, body = including(list(foo = "bar")))
## excluding
wi_th(req, body = excluding(list(foo = "bar")))
# basic auth
## including
wi_th(req, body = including(list(foo = "bar")))
## excluding
wi_th(req, body = excluding(list(foo = "bar")))
```
