

# Package ‘Crosstabs.Loglinear’

January 20, 2025

**Title** Cross Tabulation and Loglinear Analyses of Categorical Data

**Version** 0.1.1

**Date** 2022-12-11

**Description** Provides 'SPSS'- and 'SAS'-like output for cross tabulations of two categorical variables (CROSSTABS) and for hierarchical loglinear analyses of two or more categorical variables (LOGLINEAR). The methods are described in Agresti (2013, ISBN:978-0-470-46363-5), Ajzen & Walker (2021, ISBN:9780429330308), Field (2018, ISBN:9781526440273), Norusis (2012, ISBN:978-0-321-74843-0), Nussbaum (2015, ISBN:978-1-84872-603-1), Stevens (2009, ISBN:978-0-8058-5903-4), Tabachnik & Fidell (2019, ISBN:9780134790541), and von Eye & Mun (2013, ISBN:978-1-118-14640-8).

**License** GPL (>= 2)

**Imports** stats, utils

**LazyLoad** yes

**LazyData** yes

**NeedsCompilation** no

**Author** Brian O'Connor [aut, cre]

**Maintainer** Brian O'Connor <brian.oconnor@ubc.ca>

**Repository** CRAN

**CROSSTABS**

*Cross tabulations of two categorical variables*

### Description

Provides 'SPSS'- and 'SAS'-like output for cross tabulations of two categorical variables. The input can be raw data, a contingency table, or a dataframe with cell frequency counts. The output includes the contingency table, expected frequencies, Pearson's Chi-Square, Yates's Chi-Square (continuity correction), the Likelihood Ratio, Fisher's Exact p, the Linear-by-Linear Association.', the McNemar Test, the contingency coefficient C, phi, Cramer's V, Cohen's W, the residuals, standardized residuals, and adjusted residuals. Additional output for 2-by-2 tables includes the risk difference, the risk ratio, the odds ratio, and Yule's Q.

**Usage**

```
CROSSTABS(data, data_type = 'raw', variables=NULL, Freq = NULL, verbose=TRUE)
```

**Arguments**

data	The input data, which can be raw data, a contingency table, or a dataframe with cell frequency counts (see the Examples below).
data_type	The kind of input data. The options are 'raw' (for raw data), 'cont.table' (for a two-dimensional contingency table), or 'counts' (for a dataframe with the cell frequency counts).
variables	(optional) The two variable names, which is required if data_type = 'raw' or 'counts', e.g., variables=c('varA','varB'). Not required if data_type = 'cont.table'.
Freq	(optional) If data_type = 'counts', then Freq is the name of the column in data that has the frequency counts. If unspecified, it will be assumed that the column is named 'Freq'.
verbose	(optional) Should detailed results be displayed in console? The options are: TRUE (default) or FALSE.

**Value**

A list with the following possible elements:

obsFreqs	The observed frequencies.
expFreqs	The expected frequencies.
modEStab	Model test and effect size coefficients.
residuals	The residuals.
stdresiduals	The standardized residuals.
adjresiduals	The adjusted residuals.
EStab2x2	For a 2-by-2 contingency table, a list with the risk difference, the risk ratio, the odds ratio, and Yule's Q values.

## Description

A list with example data that were used in textbook presentations of categorical data analyses

## Usage

```
data(datasets)
```

## Details

A list with example data that were used in the following textbook presentations of categorical data analyses:

**datasets\$Agresti\_2019\_Tab9.3** is tabled data from Agresti (2019, p. 346).

**datasets\$Agresti\_2019\_Tab9.8** is tabled data from Agresti (2019, p. 351).

**datasets\$Ajzen\_2021\_Tab7.11** is tabled data from Ajzen and Walker (2021, p. 178).

**datasets\$Ajzen\_2021\_Tab7.16** is tabled data from Ajzen (2021, p. 180).

**datasets\$Field\_2018** is tabled data from Field (2018, Output 18.5 and Output 18.6).

**datasets\$Field\_2018\_raw** is raw data that simulates those from Field (2018, Output 18.5 and Output 18.6).

**datasets\$George\_2019\_26\_Hierarchical** is tabled data from George (2019, pp. 346-347).

**datasets\$Gray\_2012\_2wqy** is tabled data from Gray and Kinnear (2012, p. 538).

**datasets\$Gray\_2012\_3wqy** is tabled data from Gray and Kinnear (2012, p. 551).

**datasets\$Green\_2014** is tabled data from Green and Salkind (2014, p. 334).

**datasets\$Ho\_2014** is tabled data from Ho (2014, p. 513).

**datasets\$Howell\_2013** is tabled data from Howell (2013, p. 150).

**datasets\$Howell\_2017** is tabled data from Howell (2019, p. 512).

**datasets\$Meyers\_2013** is tabled data from Meyers (2013, p. 693).

**datasets\$Noursis\_2012\_marital** is tabled data from Noursis (2012a, p. 3).

**datasets\$Noursis\_2012\_voting\_degree** is tabled data from Noursis (2012b, p. 513).

**datasets\$Noursis\_2012\_voting\_degree\_sex** is tabled data from Noursis (2012b, p. 527).

**datasets\$Stevens\_2009\_HeadStart\_1** is tabled data from Stevens (2009, p. 472).

**datasets\$Stevens\_2009\_HeadStart\_2** is tabled data from Stevens (2009, p. 474).

**datasets\$Stevens\_2009\_Inf\_Survival** is tabled data from Stevens (2009, p. 481).

**datasets\$TabFid\_2019\_small** is tabled data from Tabachnick and Fidell (2019, p. 677).

**datasets\$Warner\_2020\_titanic** is tabled data from Warner (2020, p. 525).

**datasets\$Warner\_2020\_dog** is tabled data from Warner (2020, p. 530).

## Description

Provides 'SPSS'- and 'SAS'-like output for hierarchical loglinear analyses of two or more categorical variables. The input can be raw data, a contingency table, or a dataframe with cell frequency counts. The output includes: (1) a table with the K-Way and higher-order effects; (2) a table with the K-Way effects; (3) a table with the partial associations; (4) a table with the parameter estimates; (5) a table with the backward elimination statistics; (6) a table with the final model goodness of fit tests; and (7) a table with the final model observed and expected frequencies, standardized residuals, and adjusted residuals.

## Usage

```
LOGLINEAR(data, data_type = 'raw', variables=NULL, Freq = 'Freq', verbose=TRUE)
```

## Arguments

<code>data</code>	The input data, which can be raw data or a dataframe with cell frequency counts (see the Examples below).
<code>data_type</code>	The kind of input data. The options are 'raw' (for raw data), 'cont.table' (for a two-dimensional contingency table), or 'counts' (for a dataframe with the cell frequency counts).
<code>variables</code>	The variable names. Two or more variable names must be specified, as in, <code>variables=c('varA','varB', 'varC')</code> .
<code>Freq</code>	(optional) If <code>data_type = 'counts'</code> , then <code>Freq</code> is the name of the column in <code>data</code> that has the frequency counts. If unspecified, it will be assumed that the column is named 'Freq'.
<code>verbose</code>	(optional) Should detailed results be displayed in console? The options are: TRUE (default) or FALSE.

## Details

The purpose of hierarchical loglinear procedures is to find a model that best fits data given the model-fitting constraints, and to then provide the model parameters. The analyses begin with the saturated model, which includes all possible terms and for which there is a perfect fit to data. Terms are then tested for possible exclusion, which occurs when removal of a term does not result in a statistically significant reduction in fit *and* when a term is not involved in any higher order interactions. This function provides statistics for the saturated model, for the hierachal removal of the model terms, for the backward elimination steps, and for the final model.

When `data_type = 'cont.table'`, the data must be a two-dimensional contingency table that has the names of the table dimensions/variables. See the Examples below.

## Value

A list with the following possible elements:

<code>KwayH0</code>	A table with the K-Way and higher-order effects.
<code>Kway</code>	A table with the K-Way effects.

**PartialAssociations**

A table with the partial associations.

**paramests** A table with the parameter estimates.

**StepSummTab** A table with the backward elimination statistics.

**FinalModeltests**

A table with the final model goodness of fit tests.

**FinalModelcells**

A table with the final model observed and expected frequencies and adjusted residuals.
